2.		
Which	of these statements about mini-batch gradient descent do you agree with?	
	Training one epoch (one pass through the training set) using mini-batch gradient desusing batch gradient descent.	cent is faster than training one epoch
0	One iteration of mini-batch gradient descent (computing on a single mini-batch) is fas descent.	ster than one iteration of batch gradient
Corr	ect	
	You should implement mini-batch gradient descent without an explicit for-loop over	different mini-batches, so that the

3.

Why is the best mini-batch size usually not 1 and not m, but instead something in-between?

algorithm processes all mini-batches at the same time (vectorization).

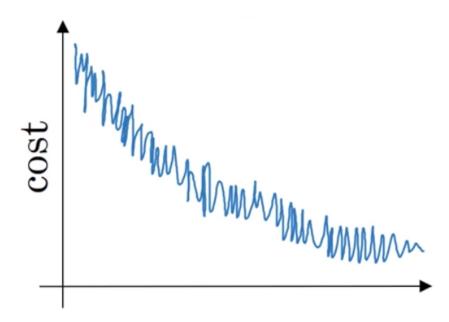

If the mini-batch size is 1, you end up having to process the entire training set before making any progress.

# Un-selected is correct Optimization algorithms Quiz, 10 questions If the mini-batch size is 1, you lose the benefits of vectorization across examples in the mini-batch. Correct If the mini-batch size is m, you end up with batch gradient descent, which has to process the whole training set before making progress. Correct If the mini-batch size is m, you end up with stochastic gradient descent, which is usually slower than mini-batch gradient descent. Un-selected is correct

4.

Suppose your learning algorithm's cost J, plotted as a function of the number of iterations, looks like this:

Which of the following do you agree with?

	Whether you're using batch gradient descent or mini-batch gradient descent, something is wrong.
	Whether you're using batch gradient descent or mini-batch gradient descent, this looks acceptable
$\bigcirc$	

If you're using mini-batch gradient descent, this looks acceptable. But if you're using batch gradient descent, something is **Optimization algorithms** 

Quiz, 10 questions

Correct

If you're using mini-batch gradient descent, something is wrong. But if you're using batch gradient descent, this looks acceptable.

5.

Suppose the temperature in Casablanca over the first three days of January are the same:

Jan 1st:  $heta_1 = 10^o C$ 

Jan 2nd:  $heta_2 10^o C$ 

(We used Fahrenheit in lecture, so will use Celsius here in honor of the metric world.)

Say you use an exponentially weighted average with  $\beta=0.5$  to track the temperature:  $v_0=0$ ,  $v_t=\beta v_{t-1}+(1-\beta)\theta_t$ . If  $v_2$  is the value computed after day 2 without bias correction, and  $v_2^{corrected}$  is the value you compute with bias correction. What are these values? (You might be able to do this without a calculator, but you don't actually need one. Remember what is bias correction doing.)

- $v_2=10$ ,  $v_2^{corrected}=10$
- $igcup v_2=10$ ,  $v_2^{corrected}=7.5$
- $igcup v_2=7.5$ ,  $v_2^{corrected}=10$

Correct

 $v_2=7.5$ ,  $v_2^{corrected}=7.5$

6

Which of these is NOT a good learning rate decay scheme? Here, t is the epoch number.

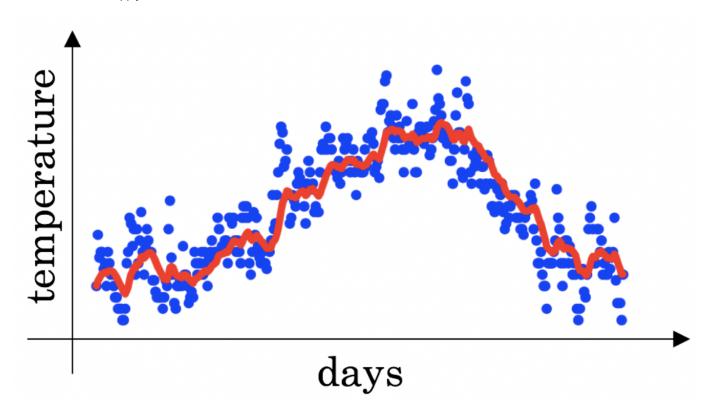

- $\alpha = \frac{1}{\sqrt{t}} \alpha_0$
- $lpha = rac{1}{1+2*t}lpha_0$
- $lpha = 0.95^t lpha_0$
- $\alpha = e^t \alpha_0$

Correct

7.

You use an exponentially weighted average on the London temperature dataset. You use the following to track the temperature:  $v_t = \beta v_{t-1} + (1-\beta)\theta_t$ . The red line below was computed using  $\beta = 0.9$ . What would happen to your red curve as you vary  $\beta$ ? (Check the two that apply)

## Increasing $\beta$ will shift the red line slightly to the right.

### Correct

True, remember that the red line corresponds to  $\beta=0.9$ . In lecture we had a green line \$\$\beta=0.98\$) that is slightly shifted to the right.

### Correct

True, remember that the red line corresponds to  $\beta=0.9$ . In lecture we had a yellow line \$\$\beta=0.98\$ that had a lot of oscillations.

Increasing eta will create more oscillations within the red line.

8.

Consider this figure:

These plots were generated with gradient descent; with gradient descent with momentum ( $\beta$  = 0.5) and gradient descent with momentum ( $\beta$  = 0.9). Which curve corresponds to which algorithm?

0

(1) is gradient descent. (2) is gradient descent with momentum (small  $\beta$ ). (3) is gradient descent with momentum (large  $\beta$ )

### Correct

- (1) is gradient descent with momentum (small  $\beta$ ), (2) is gradient descent with momentum (small  $\beta$ ), (3) is gradient descent (1) is gradient descent. (2) is gradient descent with momentum (large  $\beta$ ). (3) is gradient descent with momentum (small  $\beta$ )
- (1) is gradient descent with momentum (small  $\beta$ ). (2) is gradient descent. (3) is gradient descent with momentum (large  $\beta$ )

9.

Suppose batch gradient descent in a deep network is taking excessively long to find a value of the parameters that achieves a small value for the cost function  $\mathcal{J}(W^{[1]},b^{[1]},...,W^{[L]},b^{[L]})$ . Which of the following techniques could help find parameter values that attain a small value for  $\mathcal{J}$ ? (Check all that apply)

Try using Adam

### Correct
